Mazes on Uniform Polyhedra

Hammer projection

Introduction

Let us take an example. We are given a uniform polyhedron.

rhombicuboctahedron

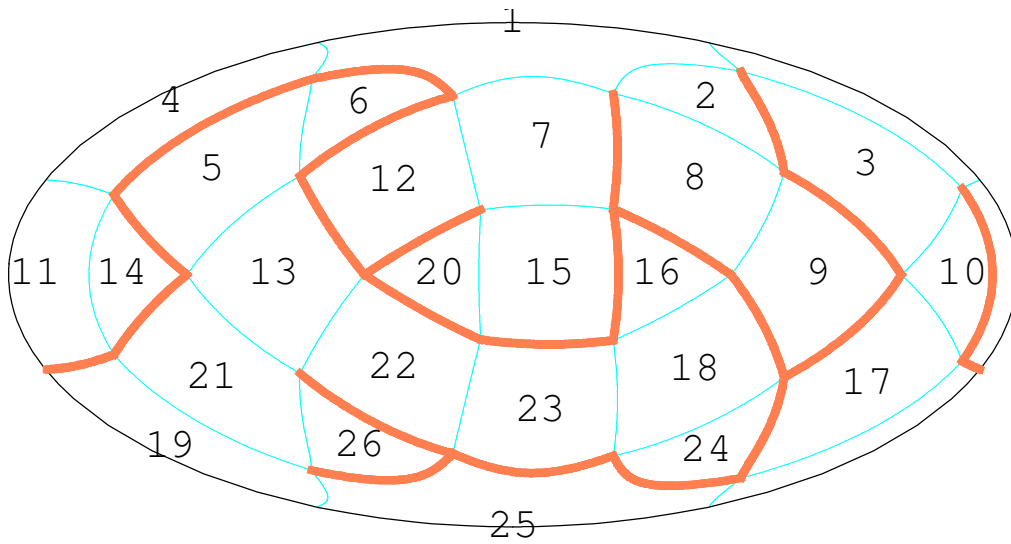

{4, 3, 4, 4}

In Mathematica the polyhedron is given by a list of faces and with a list of coordinates of vertices [Roman E. Maeder, *The Mathematica Programmer II*, Academic Press 1996]. The list of faces consists of a list of lists, where a face is represented by a list of vertices, which is given by a matrix. Let us show the first five faces:

$$\begin{pmatrix} \{1, 2, 6, 3\} \\ \{1, 3, 4\} \\ \{1, 4, 10, 5\} \\ \{1, 5, 8, 2\} \\ \{2, 8, 14, 7\} \end{pmatrix}$$

The next two figures represent faces and vertices. The polyhedron is projected onto a sphere and the sphere is projected by a cartographic projection.

The problem is to find the path from the black dot to gray dot, where thick lines represent walls of a maze.

The solution is given by a list of faces passed from the black to gray dot.

Problems

1.

tetrahedron

{3, 3, 3}

2.

truncated tetrahedron

{6, 6, 3}

3.

octahemioctahedron
